- 4 Problem Solving Lab VI

# Course Guide

## Objectives and Readings

### Objectives

- Find a position function when acceleration, initial velocity, and initial position are all known.
- Understand the derivation of the physics equations of motion (the so-called kinematics equations).
- Use parametric equations to describe the motion of a projectile.

### Read

- Stewart, Chapter 13, section 4, pages 870-878.

# Outline

- 1 **Course Guide**
  - Objectives and Readings
  - **Think About and Mathematica**
- 2 Motion in Space
- 3 Projectile Firing "Launchers"
  - Projectile Launching Part I
  - Projectile Launching Part II
  - Projectile Launching Part III
  - Baseball Hit
  - Board Work
- 4 Problem Solving Lab VI

# Course Guide

## Think About

- What does the size of a vector mean? How does this relate to acceleration and velocity?
- What assumptions are made to simplify the projectile motion problem? How would you include the things you assume do not effect projectile motion?

# Course Guide

## Mathematica Commands and Tasks You Need To Know

- The `Solve` command will be used a lot when solving projectile motion problems. It is designed to work with both normal and vector functions but you must be careful.
- For example if you know the position equation of a projectile is  $\vec{r}(t) = \langle t^2 + 10, t^2 + 10, t^2 + 10 \rangle$ .
- In order to solve for when the  $x$  component is zero you have to use only the  $x$  parametric equation using the following:

```
Solve[t^2 + 10 == 0, t]
```

- If you wanted to solve for when the projectile was at the position  $\langle 1, 1, 1 \rangle$  you would use:

```
Solve[r[t] == {1, 1, 1}, t]
```

# Motion in Space

- Similar to last class on Arc Length we start with a position vector

$$\vec{r}(t) = \langle t^2, e^t, te^t \rangle$$

- To get the velocity vector we simply take the derivative of the position vector

$$\vec{v}(t) = \vec{r}'(t) = \langle 2t, e^t, (1+t)e^t \rangle$$

- To get the speed of the particle we take the absolute value

$$|\vec{v}(t)| = \sqrt{4t^2 + e^{2t} + (1+t)^2 e^{2t}}$$

# Motion in Space

- Finally to find the particles acceleration we take the derivative of the velocity vector

$$\vec{a}(t) = \vec{v}'(t) = \langle 2, e^t, (2+t)e^t \rangle$$

  - Board Work
- 4 Problem Solving Lab VI

# Projectile Launching Part I

- Start the launcher at the origin like we are firing from the ground.
- Force due to gravity acts downward so we have  
$$\mathbf{F} = m\mathbf{a} = -mg\mathbf{j}$$
- $g = |\mathbf{a}| \approx 9.8m/s^2$ . or  $g = |\mathbf{a}| \approx 32ft/s^2$ . So  $\mathbf{a} = -g\mathbf{j}$
- Since  $\mathbf{v}'(t) = \mathbf{a}$ , we have  $\mathbf{v}(t) = -gt\mathbf{j} + \mathbf{C}$
- $\mathbf{C} = \mathbf{v}(0) = \mathbf{v}_0$  So we get  $\mathbf{r}'(t) = \mathbf{v}(t) = -gt\mathbf{j} + \mathbf{v}_0$
- Integrating again we get  $\mathbf{r}(t) = -\frac{1}{2}gt^2\mathbf{j} + t\mathbf{v}_0 + \mathbf{D}$
- We now substitute in for  $\mathbf{D}$  our initial position which if we start at the origin is zero

# Outline

  - **Projectile Launching Part II**
  - Projectile Launching Part III
  - Baseball Hit
  - Board Work
- 4 Problem Solving Lab VI

## Projectile Launching Part II

- If we find the speed at time zero  $|\mathbf{v}_0| = v_0$
- Then we get  $\mathbf{v}_0 = v_0 \cos(\alpha)t\mathbf{i} + v_0 \sin(\alpha)t\mathbf{j}$
- So now we have  $\mathbf{r}(t) = (v_0 \cos \alpha)t\mathbf{i} + [(v_0 \sin \alpha)t - \frac{1}{2}gt^2]\mathbf{j}$
- Our parametric equations of the mortar are

$$x = (v_0 \cos \alpha)t, \quad y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2$$

# Outline

## Finding Initial Velocity

- Our parametric equations of the mortar are

$$x = (v_0 \cos \alpha)t + x_0, \quad y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 + y_0$$

## Finding Initial Velocity

- Our parametric equations of the mortar are

$$x = (v_0 \cos \alpha)t + x_0, \quad y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 + y_0$$

- If we set these equations up and fill in all the known values like our angle  $\alpha$ , the angle our projectile is launched at, our initial positions, and our final positions, we get two equations and two unknowns.

## Finding Initial Velocity

- Our parametric equations of the mortar are

$$x = (v_0 \cos \alpha)t + x_0, \quad y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 + y_0$$

- If we set these equations up and fill in all the known values like our angle  $\alpha$ , the angle our projectile is launched at, our initial positions, and our final positions, we get two equations and two unknowns.
- We can now solve for one unknown like  $v_0$ , substitute it into the other equation and solve for  $t$ . Finally we substitute one last time and get a numerical answer for  $v_0$ .

# Outline

  - Board Work
- 4 Problem Solving Lab VI

# Baseball Hit

- Simulate a hit of a baseball with your launcher
- Put a target out and measure the distance to it.
- Using the math and your known muzzle velocity adjust the angle to hit the target.
- **BONUS POINTS FOR THE LEAST TRIES OR A FIRST TIME HIT**

## The Dreaded Thayer Board Work

- If a nine iron lofts a golf ball at an angle of  $60^\circ$ , how fast would you have to swing in order to hit the ball 30 feet?
- You are standing on a hilltop located at (10, 20, 300), all distances in meters. You want to launch mortars to the north. The gun tube is set at  $70^\circ$  and the mortars fire with a velocity of 200 meters per second. With no wind, where will the projectiles land?

# Problem Solving Lab

Maybe Scorched Earth.
